MONSTERA DELICIOSA NOVA, A CURE FOR EVERYTHING

BY AMY COLPAERT

A new plant species has been discovered in Hama'Lu, it's called *monstera deliciosa nova*. The species has been discovered by Lilo Halia, head researcher at Hama's Green Lab. She discovered the species deep in the rainforest of Hama'Lu. It has taken almost 5 years to confirm that this is indeed a new species.

Lilo Halia, head researcher at Hama's Green Lab, was on a mission to observe the indigenous animals of the rainforest when she discovered the new species. 'I was observing the golden lion tamarin when I saw it eating a plant species that I did not recognize,' says Lilo Halia. 'After further investigation I discovered that it was in fact a new species.' The *monstera deliciosa nova* can only be found in that part of the rainforest, which makes it very special and unique. Since then Hama's Green Lab has found ways to mimic the natural habitat of the plant, it can be grown almost everywhere.

Cure for everything

The discovery of this plant is revolutionary. Research has shown that this plant has a lot of natural healing powers. It's said to cure almost any bacterial and viral infection there is. The plant can identify cells that may have been infected by bacteria or a virus. then proceed to kill those cells to stop the infection. The researchers at Hama's Green Lab have tested the species against 50 different bacteria and viruses, and found that it was an effective cure for all of them. 'In theory, it should cure everything', says Lilo Halia, the researcher who discovered the plant.
